Part 2: Imaging & Diagnostic Scan Reports

26. Ultrasound Abdomen & Pelvis (USG) Report

Findings: The liver is mildly enlarged (16 cm) and demonstrates diffusely increased echogenicity consistent with Grade I fatty liver infiltration. The gallbladder, spleen, pancreas, and both kidneys appear normal in size and structure. No abdominal masses or ascites detected.
Impression: Mild Hepatomegaly with Fatty Changes.

27. Chest X-Ray (PA View) Report

Findings: Both lung fields are clear with no signs of focal consolidation, effusion, or pneumothorax. The cardiomegaly is absent, and the bony thorax is intact.
Impression: Normal Chest Radiograph.

28. Computed Tomography (CT) Brain Report

Findings: Brain parenchyma shows normal attenuation. No evidence of acute intracranial haemorrhage, large territory infarct, or space-occupying mass lesions. Ventricles and sulci are within normal biological limits for age.
Impression: No Acute Intracranial Pathology.

29. Magnetic Resonance Imaging (MRI) Spine Report

Findings: L4-L5 level shows a mild posterior disc bulge causing slight indentation on the anterior thecal sac without significant spinal canal stenosis. Spinal cord terminates normally at L1. Surrounding paraspinal soft tissues are unremarkable.
Impression: Mild Degenerative Disc Disease at L4-L5.

30. Dual-Energy X-Ray Absorptiometry (DEXA) Bone Scan Report

Findings: Total lumbar spine (L1-L4) bone mineral density yields a T-score of -0.8. The right femoral neck yields a T-score of -0.5.
Impression: Normal Bone Density (No evidence of osteopenia or osteoporosis).
